The Zero Quality Control System (ZQC) is a mistake-proofing approach that prevents defects by monitoring processing conditions at the source and correcting errors that cause defects. Since it is human nature to make mistakes, ZQC does not blame people for errors, but instead finds ways to keep errors from becoming defects.

Mistake-Proofing is a simple and effective method to prevent defects from occurring in an organization's manufacturing, service or business process. This article describes the six mistake-proofing principles to design both product and processes so that mistakes are impossible to make or, at the least, easy and early to detect and correct.

A poka-yoke is any mechanism in any process that helps an equipment operator avoid (yokeru) mistakes (poka). Its purpose is to eliminate product defects by preventing, correcting, or drawing attention to human errors as they occur. The concept was formalised, and the term adopted, by Shigeo Shingo as part of...

Mistake proofing uses changes in the physical design of processes to reduce human error. It can be used to change designs in ways that prevent errors from occurring, to detect errors after they occur but before harm occurs, to allow processes to fail safely, or to alter the work environment to reduce the chance of errors.

This is because of mistake-proofing. While manufacturing these cables, the operator needs to take care the right pins are secured in the insulator, and the exact number of slots are drilled for perfect placement. If this is not done, the device will definitely not work.
