The NRP recommends that at every delivery, at least one person who is responsible for the care of the newborn, capable of initiating resuscitation, and skilled in the provision of PPV and chest compressions must be present. A second person skilled in more advanced resuscitation procedures should be readily available to assist.

Highlights of the 2019 Guidelines Focused Updates

In 2006, the American Academy of Pediatrics and the American Heart Association published the 2005 guidelines on neonatal resuscitation (1). The most significant effect of these guidelines on obstetric practice related to the management of delivery of a newborn with meconium-stained amniotic fluid.

neonatal resuscitation guidelines are epinephrine and normal saline (0.9% NaCl).⁶ Neither sodium bicarbonate nor Ringer's Lactate is recommended during neonatal resuscitation. Epinephrine should be given if the heart rate stays less than 60 bpm despite providing 30 seconds of effective positive-pressure ventilation that moves the chest, and another 60 seconds of coordinated chest compressions and ventilations using 100% oxygen.
