CYPRESS PRODUCT SELECTOR GUIDE FLASH MEMORY

NOR flash memory is one of two types of nonvolatile storage technologies. NAND is the other. Nonvolatile memory does not require power to retain data. NOR and NAND use different logic gates -- the fundamental building block of digital circuits -- in each memory cell to map data.

The cell size of NAND flash is almost half the size of a NOR cell. In combination with a simpler production process, NAND architecture can be offered with higher capacity for a given die size, resulting in a lower price tag.

NAND Flash Applications Design Guide - EE Times

memory, NAND Flash and NOR Flash, have emerged as the dominant varieties of non-volatile semiconductor memories utilized in portable electronics devices. NAND Flash, which was designed with a very small cell size to enable a low cost-per-bit of stored data, has been used

NAND-based solutions are ideal for high capacity data storage, while NOR is best used for code storage and execution, usually in small capacities. This table can also be used as a quick reference guide to compare NAND, NOR and DiskOnChip, since it addresses the main issues that need to be considered when choosing a flash-based storage

NOR and NAND Flash Cross Reference Guide

the first data byte compared to NOR Flash because of the resistance of the NAND cell array, although it is much faster than the seek time for a hard disc by several orders of magnitude. Therefore, the aim of NAND Flash is to replace hard disks. Figure 1.

NAND vs. NOR Flash Memory Technology Overview

The two main types of flash memory are the NOR Flash & NAND Flash. Intel is the first company to introduce commercial (NOR type) flash chip in 1988 and Toshiba released world's first NAND-flash in 1989. NOR-flash is slower in erase-operation and write-operation compared to NAND-flash. That means the NAND-flash has faster erase and write times.

NAND vs. NOR flash technology - Electronic Products

NAND Flash cells are 60% smaller than NOR Flash cells, providing the higher densities required for today's low-cost consumer de vices in a significantly reduced die area. NAND Flash is used in virtually all removable cards, including USB drives, secure digital (SD) cards, memory stick cards, CompactFlash® cards, and multimedia cards (MMCs).
