Optimal Design of Experiments in the Presence of Interference. We formalize the optimal design of experiments when there is interference between units, that is, an individual's outcome depends on the outcomes of others in her group.

Optimal Design of Experiments | Society for Industrial and ...

Given the total number of treatment runs for an experiment and a specified model, the computer algorithm chooses the optimal set of design runs from a candidate set of possible design treatment runs. This candidate set of treatment runs usually consists of all possible combinations of various factor levels that one wishes to use in the experiment.

Optimal Design of Experiments in the Presence of ...

d-optimal designs are one of many optimal design types. The d represents an optimization of the determinant matrix used in the analysis $(XX')^{-1}$. These designs require the experimenter to provide the model that they wish to fit data into.

Design of experiments - Wikipedia

A preliminary screening experiment was designed with D-optimal design criterion, which focuses on precise parameter estimation, and the experiment results indicated that the fan speed, guide plate ...

Optimal design - Wikipedia

Optimal Design of Experiments offers a rare blend of linear algebra, convex analysis, and statistics. The optimal design for statistical experiments is first formulated as a concave matrix optimization problem. Using tools from convex analysis, the problem is solved generally for a wide class of optimality criteria such as D-, A-, or E-optimality.

That is, the experimenter must specify a model for the design before a computer can generate the specific treatment combinations. Given the total number of treatment runs for an experiment and a specified model, the computer algorithm chooses the optimal set of design runs from a candidate set of possible design treatment runs. This candidate set of treatment runs usually consists of all possible combinations of various factor levels that one wishes to use in the experiment.

Optimal Design of Experiments - Friedrich Pukelsheim ...

The design of experiments is the design of any task that aims to describe and explain the variation of information under conditions that are hypothesized to reflect the variation. The term is generally associated with experiments in which the design introduces conditions that directly affect the variation, but may also refer to the design of quasi-experiments, in which natural conditions that influence the variation are selected for observation. In its simplest form, an experiment aims at predic
