thought of as real-valued functions, or as inverse functions of the corresponding exponential functions. The idea of a logarithm as an inverse function of an exponential function means that $\log_b x$ is a question to be answered. For example, you can read the expression $\log_2 8$ as "what exponent on base 2 gives 8?" The answer is 3, because $2^3 = 8$.

Periodic functions 2 Now consider the functions $y = \cos 2t$ $y = \sin 2t$ The graphs of these functions are obtained from those of $\cos t$ and $\sin t$ by compressing them along the x-axis by a factor of 2. The period of the new functions is equal to $\frac{1}{2}$, or half that of the original ones, their frequency is twice that of the originals. Figure 1.3. The graph of $y = \cos 2t$. Figure 1.4.
