Power electronics problem on diodes : Two power diodes are connected in parallel to share a current of 1 kA. Their ON state resistances are 0.6 and 0.65 m $\Omega$  respectively. Find the series resistance (m $\Omega$ ) to be connected with each of them to ensure equal current sharing with a tolerance of 5%.

The "Generation 5" SiC diodes use a new compact chip design, realized by merged pn junction engineering in the Schottky cell-field. This enables a smaller differential resistance per chip area. As a result, a reduction of the diode losses by up to 30 percent compared to the previous generation can be achieved; for example in a front-end boost stage for a 3-phase solar inverter operating at ...

Parameter  $t_a$  is the interval between the zero crossing of the diode current to it reaches  $I_{RR}$ . Parameter  $t_b$  is the time interval from the maximum reverse recovery current to 0.25 of  $I_{RR}$ . The lower  $t_{rr}$  means fast diode switching. The ratio of the two parameters  $t_a$  and  $t_b$  is known as the softness factor SF. Datasheet Parameters: For power diodes, a data sheet will show two voltage ratings.

### Power Electronics On Diode Engineering

Hello friends, I hope you all are doing great. In today's tutorial, we will discuss What is the Power Diode. The diode is a commonly used module in electrical and electronic engineering. Almost in every electronic device and engineering project diodes are used. It is a PN junction device that has 2 terminals, anode and cathode. The main function of the diode is to convert the alternating current into direct current.

### Power Diode - Electronic Projects for Engineering Students

Power diodes are usually mounted on the heat-sink to dissipate power during diode operation. And the power diode is usually characterised by average current, rms current and peak current. Snubber circuits are useful when using the diodes in switching regimes, which saves the diode from over-voltage in the reverse recovery process.

Power diodes are also similar to signal diodes but have a little difference in its construction. In signal diodes the doping level of both P and N sides is same and hence we get a PN junction, in power diodes we have a junction formed between a heavily doped P+ and a lightly doped N-layer which is epitaxially grown on a heavily doped N+ layer.
