Posts about Stochastic Process written by Dan Ma. The preceding two posts are devoted to solving the problem of determining mean time to absorption and the problem of determining the probability of absorption (using first step analysis here and using fundamental matrix here). The Markov chains in these problems are called absorbing Markov chains.

For example, we cannot discuss the probability of 0.12345 because the minimal change of the money is \$0.01. Bayesian Inference. Since the probability is viewed as our degree of belief, this value should be able to change from time to time based on the evidence. For example, it seems rational to assume any coin to be fair in the beginning.
