NURSE PROTOCOL FOR
Diabetes is caused by a problem in the way your body makes or uses insulin[1]. Insulin moves blood sugar (glucose) into cells where it is stored and later used for energy. There are two main types of diabetes: type 1 and type 2 [1]. Type 1 diabetes is also called insulin dependent diabetes mellitus (IDDM), whereas Type 2 diabetes is also called adult onset diabetes or non-insulin dependent ...

Diabetes mellitus type 2 | NHG-Richtlijnen
It is characterized by high levels of sugar in the blood. Type 2 diabetes is also called type 2 diabetes mellitus and adult-onset diabetes. That's because it used to start almost always in middle- and late-adulthood. However, more and more children and teens are developing this condition. Type 2 diabetes is much more common than type 1 diabetes ...

Type 2 Diabetes Screening and Treatment Guideline
In Type 2 diabetes (adult onset diabetes), the pancreas makes insulin, but it either doesn't produce enough, or the insulin doesn't work properly. Nine out of 10 people with diabetes have Type 2. This type occurs most often in people who are over 40 years old but can occur even in childhood if there are risk factors present.

Evaluating the impact of type 2 diabetes mellitus on ...
The mouse has proven to be a reliable model for discovering and validating new treatments for type 2 diabetes mellitus. We review here commonly used methods to measure endpoints relevant to glucose metabolism which show good translatability to the diagnostic of type 2 diabetes in humans: baseline fasting glucose and insulin, glucose tolerance test, insulin sensitivity index, and body type ...

Diabetes - type 2 | Topics A to Z | CKS | NICE
Introduction: Diabetes affects more than 9% of the adult population worldwide. Patients with type 2 diabetes mellitus (T2DM) show variable responses to some drugs which may be due, in part, to variability in the functional activity of drug-metabolising enzymes including cytochromes P450 (CYP450s).

Protocol Title: Type 2 Diabetes Mellitus
14 Verder bleek uit onderzoek dat het absolute risico om diabetes te krijgen vóór het 80e levensjaar voor ouders, broers/zussen en kinderen van patiënten met diabetes mellitus type 2 hoger is dan van familieleden van mensen zonder diabetes: voor ouders van patiënten 21% versus 9% bij controles, voor broers/zussen 38% versus 7% en voor kinderen 32% versus 15%.
