RADIOACTIVE DECAY: A SWEET SIMULATION OF HALF-LIFE Purpose: The purpose of this experiment is to understand the concept of half-life, and use the scientific method (Observing and recording data).\ Introduction: Isotopes of elements have unstable nuclei; as a result, some of the particles within the nucleus are lost or emitted.

Radioactive Decay: A Sweet Simulation of a Half-life ...

Radioactive Decay: A Sweet Simulation of Half-Life Introduction Radioactive decay rates are measured in half-lives. A half-life is the time required for one half of a radioisotope's nuclei to decay into its products. For example, the half-life of the radioisotope strontium-90 is 29 years.

dice come in whole numbers about 16 or 17 dice would be removed. If 17 are removed from the original 100, there would be 83 remaining. One could then predict in the next roll that the number of dice that would land with the 5 face up would be  $\frac{1}{6}$  (83) or 13.8. Thus the rate of decay is constant and can be used to simulate radioactive decay.
