Microwave and radio-frequency heating are an integrated part of several food processing unit-operations, whose efficiency is mainly determined by the dielectric properties (DPs). Hence, efficient and accurate measurements of DPs are essential, which can assist in modelling, assessment, and optimization of process parameters.

Subwavelength structured surfaces, known as meta-surfaces, hold promise for future compact and optically thin devices with versatile functionalities. By revisiting the concept of detour phase, we demonstrate high-efficiency holograms with broadband and chiral imaging functionalities. In our devices, the apertures of binary holograms are replaced by subwavelength structured microgratings. W
