If $D = 1$, a unique solution exists: $\angle C = 90^\circ$, i.e., the triangle is right-angled. If $D < 1$ two alternatives are possible. If $b > c$, then $\angle C > \angle B$ (the larger side corresponds to a larger angle). Since no triangle can have two obtuse angles, $\angle C$ is an acute angle and the solution $\angle C = \arcsin D$ is unique.

A right triangle is a kind of triangle that has one angle that measures $C=90^\circ$. In a right triangle, the side c that is opposite of the $C=90^\circ$ angle, is the longest side of the triangle and is called the hypotenuse. The variables a , b are the lengths of the shorter sides, also called legs or arms.

The Right-angled Triangles Calculator. At least one dimension, of edge-length or area, has to be supplied. Remember the drawing is NOT to scale. It is for illustration of the parts only. Sometimes two different solutions are possible. If one edge is known, and one angle; try putting in the edge length first as a and second as b ; while putting in the angle as the SAME letter each time.
