In this section, we present the Scilab graphics features which con figure the title, axes and legends of an x-y plot. In the following example, we de fi ne a quadratic function and plot it with the plot function. function f = myquadratic (x) f = x.^2 endfunction xdata = linspace (1 , 10 , 50); ydata = myquadratic (xdata); plot (xdata , ydata)

Scilab provides a programming structure called script that lets you type a block of statements, assign a name to it, and then call it by name whenever you want your program to execute it. Scripts and functions (procedures) provide the following advantages:

Step 1: The purpose of this tutorial. The purpose of this Scilab tutorial is to provide a collection of plotting examples that can be used in Scilab to show data. Here, on the right, we report some definitions used when plotting data on figures. Step 2: Roadmap. Examples refer to 1D, 2D, vector fields and 3D problems.

where t is a real scalar (the time) and y a real vector (the state) and ydota real vector (the first order derivative dy/dt).. If f is a string, it is the name of a Fortran subroutine or a C compiled function. For example, if we call ode(y0,t0,t,"fex"), then the subroutine fex is called.. The Fortran routine must have the header:

For example, the Scilab / Tcl interface (TclSci), the graphic editor and the variable editor are not working. These features will be rewritten in Java in future versions of Scilab and these limitations will disappear. Still, using Scilab on Mac OS system is easy, and uses the shorcuts which are familiar to users of this platform.

In this Scilab tutorial, we introduce readers to the Control System Toolbox available in Scilab/Xcos and known as CACSD. This first tutorial is dedicated to "Linear Time Invariant" (LTI) systems and their representations in Scilab. An RLC example is used to explain state-space representation, transfer function, and the zero-pole representations.

The instruction is the piece of code that is evaluated each time the control variable is incremented as long as the condition within the expression is satisfied.. Let ' s apply the for loop structure to our function (in a Scilab script):. for x=1:1:5 f(x) = x^2 + sqrt(x); end. In our example x is the index which gets incremented and also the function argument.
