Once you've measured the width, the other thing you need to make sure of is that your monitor is set to its native display resolution, which is the actual number of pixels your screen can display from left to right and from top to bottom. For example, a monitor with a native display resolution of 1920 x 1080 (commonly referred to these days as "full HD") contains 1920 pixels from left to right ...

Windows scaling issues for high-DPI devices
In the simplest (non-existent) case, each dot on the mouse's pad corresponds to one pixel on the screen. So, for example, if your screen resolution was 1920x1200 and your mouse was capable of a maximum DPI of 600, you'd have to move your mouse two inches to get from the bottom of the screen to the top. If your mouse used a DPI of 1200, it would only take one inch to make the same movement on the screen. Therefore higher mouse DPI allows you to move faster on the screen with less mouse movement.
