Video transcript. So if g is a solution of the differential equation-- of this second order linear homogeneous differential equation-- and h is also a solution, then if you were to add them together, the sum of them is also a solution. So in general, if we show that g is a solution and h is a solution, you can add them.

Differential equation - Wikipedia
As expected for a second-order differential equation, this solution depends on two arbitrary constants. However, note that our differential equation is a constant-coefficient differential equation, yet the power series solution does not appear to have the familiar form (containing exponential functions) that we are used to seeing.

SECOND-ORDER LINEAR DIFFERENTIAL EQUATIONS
Second-order nonlinear (due to sine function) ordinary differential equation describing the motion of a pendulum of length L : $\ddot{\theta} + \frac{g}{L}\sin\theta = 0$. Second Order Differential Equations
Principle of Superposition. If $y_1(t)$ and $y_2(t)$ are two solutions to a linear, second order homogeneous differential equation and they are "nice enough" then the general solution to the linear, second order homogeneous differential equation is given by (3).

Second-Order Linear Ordinary Differential Equations
Video transcript. So the most general solution to this differential equation is $y = c_1 e^{2x} + c_2 e^{-3x}$. we could say y of x , just to hit it home that this is definitely a function of x -- y of x is equal to $c_1 e^{2x} + c_2 e^{-3x}$. And this is the general solution of this differential equation.

Second Order Differential Equations
Second-Order Ordinary Differential Equation. Nonhomogeneous ordinary differential equations can be solved if the general solution to the homogenous version is known, in which case variation of parameters can be used to find the particular solution. In particular, the particular solution to a nonhomogeneous second-order ordinary differential equation.

2.3 General Solution Consider the second order homogeneous linear differential equation: $y'' + p(x)y' + q(x)y = 0$ where $p(x)$ and $q(x)$ are continuous functions, then (1) Two linearly independent solutions of the equation can always be found. (2) Let $y_1(x)$ and $y_2(x)$ be any two solutions of the homogeneous equation.

Second Order Differential Equation Solution
In general, given a second order linear equation with the y -term missing $y'' + p(t)y' = g(t)$, we can solve it by the substitutions $u = y'$ and $u' = y''$ to change the equation to a first order linear equation. Use the integrating factor method to solve for u , and then integrate u to find y . That is: 1. Substitute : $u' + p(t)u = g(t)$ 2.

First and Second Order Differential Equations
We see that the second order linear ordinary differential equation has two arbitrary constants in its general solution. $2(x)$ are linearly independent if one is not a multiple of the other. $y^2 dy + dx + 8y = 0$ Write down the general solution of this equation. $1 = e^{4x}$ is indeed a solution.

Second Order Linear Differential Equations
We can solve a second order differential equation of the type: $d^2 y/dx^2 + P(x) dy/dx + Q(x)y = f(x)$ where $P(x)$, $Q(x)$ and $f(x)$ are functions of x , by using: Variation of Parameters which only works when $f(x)$ is a polynomial, exponential, sine, cosine or a linear combination of those.
