If we examine an LPDDR4-4266 solution from an internal LPDDR4 controller and LPDDR4 PHY perspective, it is notable that while the PHY will typically run at the same speed as the memory, or a maximum of 2133 MHz, the interface between the LPDDR4 controller and PHY (e.g., the DFI interface) will typically run at half that speed, or 1066 MHz.

Inorganic semiconductor based micro-LEDs have recently attracted tremendous interests of both industrial developers and academic researchers for the realization of next-generation displays. The reduction of LED sizes causes performance degradation and increased fabrication challenges. In this paper, we introduce a tandem device scheme based on stacked red, green, and blue (RGB) micro-LEDs for ...
