Two radicals of a ring are commonly used in Commutative Algebra: the Jacobson radical, which is the intersection of all maximal ideals, and the nilradical, which is the set of all nilpotent elements. Closely related to the nilradical is the radical of a subset. We define these three radicals, and discuss examples.

Further, every ring is commutative (that is, $xy = yx$), with an occasional exception, which is always marked (normally, it's a ring of matrices). As usual, the additive identity is denoted by 0. Note that, for any x in R , $x \cdot 0 = 0$; indeed, $x \cdot 0 = x(0+0) = x \cdot 0 + x \cdot 0$, and $x \cdot 0$ can be canceled by adding $-(x \cdot 0)$.
