Linear Equations - Definition, Formula, Examples & Solutions

Three possible outcomes for solutions to systems of equations. Recall that the solution for a system of equations is the value or values that are true for all equations in the system. There are three possible outcomes for solutions to systems of linear equations.

Solving Equations with Infinite Solutions or No Solutions ...

Basics of Algebra cover the simple operation of mathematics like addition, subtraction, multiplication, and division involving both constant as well as variables. For example, $x+10 = 0$. This introduces an important algebraic concept known as equations. The algebraic equation can be thought of as a scale where the weights are balanced through numbers or constants.

There are linear equations in one variable and linear equations in two variables. The standard form of a linear equation in one variable is of the form $Ax + B = 0$. An equation of the form $Ax + By = C$ is called a linear equation in two variables. A few examples of linear equations are $5x + 6 = 1$, $42x + 32y = 60$, $7x = 84$.

Linear Algebra - Questions with Solutions

Many quadratic equations can be solved by factoring when the equation has a leading coefficient of 1 or if the equation is a difference of squares. The zero-factor property is then used to find solutions. Many quadratic equations with a leading coefficient other than 1 can be solved by factoring using the grouping method.
