We present a general methodology for performing statistical inference on the components of a real-valued matrix parameter for which columns are subject to order restrictions. The proposed estimation procedure is based on an iterative algorithm developed by Dykstra and Robertson (1982) for simple order restriction on rows and columns of a matrix.

Statistical inference under order restrictions 83 where ct_j is the inverse of i.e. the inverse of the variance of $\hat{\theta}^{\text{MLE}}$. Although each of the components used in the construction of $\hat{\theta}_i$ satisfy the desired order restriction, $i = 1, 2, \dots, p$ may not satisfy the desired order restriction in the desired order, we begin with the lead
