Stoichiometry / ? s t ? ? k i ? ? m ? t r i / is the calculation of reactants and products in chemical reactions.. Stoichiometry is founded on the law of conservation of mass where the total mass of the reactants equals the total mass of the products, leading to the insight that the relations among quantities of reactants and products typically form a ratio of positive integers.

STOICHIOMETRY Mathematics of the Chemical Equation

The Mathematics of Chemical Equations (Stoichiometry) A major task of the chemist is to project how much product can be produced from a certain amount of reactant. The amount of product produced must have more value than the reactants plus the added cost of safely disposing of any waste product produced.

In stoichiometry, balanced equations make it possible to compare different elements through the stoichiometric factor discussed earlier. This is the mole ratio between two factors in a chemical reaction found through the ratio of stoichiometric coefficients.

Unit 8 Stoichiometry - North Allegheny

Stoichiometry expresses the quantitative relationship between reactants and products in a chemical equation. Stoichiometric coefficients in a balanced equation indicate molar ratios in that reaction. Stoichiometry allows us to predict certain values, such as the percent yield of a product or the molar mass of a gas.

Chemical Equations and Calculations

The coefficients in a balanced equation can be used to form mole ratios relating reactants to products. The coefficients in a balanced chemical equation tell the relative volumes of reactants and products, expresses in any suitable unit of volume.
