The Enable-RemoteMailbox cmdlet mail-enables an existing on-premises user. The mail-enabled user contains a specific attribute that indicates that an associated mailbox in the service should be created when the user is synchronized to the service using directory synchronization. Directory synchronization must be configured correctly for a mailbox to be created in the service.

burningmanphotos.rgj.com

In this post I describe a problem that I've been asked about several times related to session state. The scenario goes something like this: Scaffold a new ASP.NET Core application; Set a string in session state for a user, e.g. `HttpContext.Session.SetString("theme", "Dark");` On the next request, try to load the value from session using `HttpContext.Session.GetString("theme");` but get back null!
