Ultraviolet (UV) is a form of electromagnetic radiation with wavelength from 10 nm (with a corresponding frequency around 30 PHz) to 400 nm (750 THz), shorter than that of visible light, but longer than X-rays. UV radiation is present in sunlight, and constitutes about 10% of the total electromagnetic radiation output from the Sun. It is also produced by electric arcs and specialized lights ...

Organic Molecules - CliffsNotes

The chemical reactions that take place in living cells are similar as well. Green plants use the energy of sunlight to convert water ( $H_2O$ ) and carbon dioxide ( $CO_2$ ) to carbohydrates (sugars and starches), other organic (carbon-containing) compounds, and molecular oxygen ( $O_2$ ). The process of photosynthesis requires energy, in the form of sunlight, to split one water molecule into one-half of ...

ADVERTISEMENTS: Molecular

Markers: A molecular marker is a DNA  
sequence in the genome which can be  
located and identified. As a result of  
genetic alterations (mutations, insertions,  
deletions), the base composition at a  
particular location of the genome may be  
different in different plants. These  
differences, collectively called as  
polymorphisms can be mapped and

Potassium is the chemical element with the symbol K (from Neo-Latin kalium) and atomic number 19. Potassium is a silvery-white metal that is soft enough to be cut with a knife with little force. Potassium metal reacts rapidly with atmospheric oxygen to form flaky white potassium peroxide in only seconds of exposure. It was first isolated from potash, the ashes of plants, from which its name ...

aminoácidos, dispuestos en una cadena lineal y unidos por enlaces peptídicos. Las enzimas son proteínas que catalizan las reacciones químicas en el metabolismo. Otras proteínas cumplen funciones estructurales o mecánicas, como las proteínas del citoesqueleto, que configuran un sistema de andamiaje para mantener la forma de la célula.

### Ultraviolet - Wikipedia

The cell cycle, or cell-division cycle, is the series of events that take place in a cell that cause it to divide into two daughter cells. These events include the duplication of its DNA (DNA replication) and some of its organelles, and subsequently the partitioning of its cytoplasm, chromosomes and other components into two daughter cells in a process called cell division.
