Ferric chloride is an orange to brown-black solid. It is slightly soluble in water. It is noncombustible. When wet it is corrosive to aluminum and most metals. Pick up and remove spilled solid before adding water. It is used to treat sewage, industrial waste, to purify water, as an etching agent for engraving circuit boards, and in the manufacture of other chemicals.

Phenotypic plasticity represents the most relevant hallmark of the carcinoma cell as it bestows it with the capacity of transiently altering its morphological and functional features while en route to the metastatic site. However, the study of phenotypic plasticity is hindered by the rarity of these events within primary lesions and by the lack of experimental models.

The basis for this is that the chemistry and biochemistry of the aluminium ion (Al<sup>3+</sup>) dominate the pathways that lead to toxic outcomes. Most aluminium compounds currently used in industry, pharmaceuticals, food additives, cosmetics and other household products are identified in this section (see Tables 1 and 2).

Agarose gel electrophoresis is a method of gel electrophoresis used in biochemistry, molecular biology, genetics, and clinical chemistry to separate a mixed population of macromolecules such as DNA or proteins in a matrix of agarose, one of the two main components of agar. The proteins may be separated by charge and/or size (isoelectric focusing agarose electrophoresis is essentially size ...

Glucose is usually present in solid form as a monohydrate with a closed pyran ring (dextrose hydrate). In aqueous solution, on the other hand, it is an open-chain to a small extent and is present predominantly as  $\alpha$ - or  $\beta$ -pyranose, which interconvert (see mutarotation). From aqueous solutions, the three known forms can be crystallized:  $\alpha$ -glucopyranose,  $\beta$ -glucopyranose and  $\gamma$ -glucopyranose ...
