Hydraulic engineering as a sub-discipline of civil engineering is concerned with the flow and conveyance of fluids, principally water and sewage. One feature of these systems is the extensive use of gravity as the motive force to cause the movement of the fluids. This area of civil engineering is intimately related to the design of bridges, dams, channels, canals, and levees, and to both ...

Water quality refers to the chemical, physical, biological, and radiological characteristics of water. It is a measure of the condition of water relative to the requirements of one or more biotic species, or to any human need or purpose. It is most frequently used by reference to a set of standards against which compliance, generally achieved through treatment of the water, can be assessed.

Hydraulic conductivity of selected consolidated and unconsolidated geologic materials (from Heath 1983). Grain Size Relationships. A number of empirical formulas, some dating back over a century, have been proposed which attempt to relate the hydraulic conductivity of an unconsolidated geologic material (granular sediment or soil) to its grain size distribution obtained from sieve analysis.
