Petrol engines can use gasoline direct injection, where the fuel is directly delivered into the combustion chamber, or indirect injection where the fuel is mixed with air before the intake stroke.

The figure at the top shows the major components of the electrical system on the Wright 1903 engine. In any internal combustion engine, fuel and oxygen are combined in a combustion process to produce the power to turn the crankshaft of the engine. The job of the electrical system is to provide the spark which initiates combustion.

Fuel systems using air valve carburetors provide triple safety seals. When the engine is stopped, fuel cannot pass the air valve because the air valve spring holds the air valve closed. At the same time, neither the pressure regulator nor the vacuum fuellock filter allows the fuel flow as there is no vacuum signal from the engine.

A complex network of wires runs through the car. To avoid confusion, each wire is colour coded (but only within the car: there is no national or international system of colour-coding). Most car handbooks and service manuals include a wiring diagram which can be difficult to follow. The colour-coding, however, is a useful guide to tracing wiring.
